

# AudioControl Concert Maestro Crestron Driver

## Introduction

This driver has been designed to provide control of the AudioControl Concert Maestro series of AV receivers/processors via an IP or Serial connection.

NOTE for Best control of the Concert Maestro, when using IP, make sure the Crestron is the only equipment control the Concert Maestro

## Driver Installation and Configuration

In SIMPL Windows, click File > Open and navigate to your .smw program file. The module should appear in your **Program View**.

Select **Central Control Module** in the **Program View**, then click the **Configure** button in the toolbar to select the model of your Crestron processor.

To configure the driver, navigate to the .umc files.

If you have installed the serial driver, connect the Serial\_RX and Serial\_TX signals and set the Baud rate to 38400. Ensure that the serial cable is connected to your AudioControl device.

If using the IP driver, enter the IP of the Concert Maestro device in your parameters. If there is a failure connect, first ensure that your device and the Crestron processor are both connected to the same network. If this does not resolve the issue, consult the manual provided by AudioControl.

## Device Configuration

Configure your device as per the manufacturer's instructions. To find a copy of the user manual for your device, select your model from the manufacturer's website here:  
<https://www.audiocontrol.com/home-audio/receivers/> <https://www.audiocontrol.com/home-audio/preamp-processors/>

You must configure your device with your desired control method. To set your preferred control method, navigate to Menu > General Setup > Control on the device and set it to either RS232 or IP.

If using IP it is recommended that you use a static IP address for the Concert Maestro.

If using an RS232 connection, refer to the manufacturer's documentation regarding cable wiring.

We also recommend configuring the power settings for your device to allow full control using the driver. Hold the Menu button on the front of the unit for four seconds to access the Extended Menu. Here, you can set the Standby Mode to "manual", which will allow the driver to control the unit when it is in standby mode.

Under Menu > HDMI Settings set HDMI Bypass & IP to "On".

These parameters can all be modified using the unit's control panel, or - if it is connected to a network via IP - by typing the unit's IP address into your web browser.

## Driver Commands

The driver allows control of the Concert Maestro unit using a Crestron touch panel or equivalent device. Commands to set the zone, source, EQ and advanced audio options are available.

Some sources, as per the Concert Maestro unit, can be selected but not directly controlled by the driver. Sources that allow for direct control are as follows:

- Bluetooth
- DAB Radio
- FM Radio
- Net

Common functions (play, pause, fast-forward, shuffle etc.) may be called from the driver on these sources. For a comprehensive list of commands, please consult your AudioControl unit's User Manual or API Guide.

# Driver Variables

This driver tracks a number of variables in order to provide feedback from the Concert Maestro unit. These are as follows:

## Status

- Connection status
- Power/standby status
- Software version

## Inputs

- Current source
- Current zone
- Audio input analogue/digital/HDMI

## Outputs

- Master volume
- Mute
- Source EQ/Advanced audio
- HDMI out

## Advanced audio

- Treble EQ
- Bass EQ
- Balance
- LipSync delay
- Subwoofer trim
- Subwoofer stereo trim
- Dolby Leveller
- Compression
- IMAX Enhanced
- Direct mode

## Surround Sound Modes

Surround sound modes are selected via the DECODE\_MODE\_SET analogue input. Feedback is provide by the corisponding STEREO\_DECODE\_MODE and MULTI\_CHANNEL\_DECODE\_MODE analogue outputs.

- STEREO - 1
- MULTI\_CHANNEL - 2
- DOLBY\_SURROUND - 3
- NEO\_6\_CINEMA - 4
- NEO\_6\_MUSIC - 5
- 5\_7\_CH\_STEREO - 6
- DTS\_NEURAL\_X - 7
- RESERVED - 8
- DTS\_VIRTUAL\_X - 9
- DOLBY\_VIRTUAL\_HEIGHT - 10
- AURO\_NATIVE - 11
- AURO\_MATIC\_3D - 12
- AURO\_2D - 13

## **Radio**

- DAB station
- DAB metadata
- FM frequency
- FM genre/RDS info
- Radio presets

## **Net**

- Now playing data (artist/album/track)
- Application
- Sample rate
- Audio encoder

# Troubleshooting

- Confirm the Ethernet switch used by the AudioControl unit is correctly uplinked to the same network as the Crestron processor.
- Confirm that the correct IP address is defined in the Crestron parameters for the Concert Maestro control interface.

- Some sources do not make use of all the parameters in Advanced Audio. For these sources, unimplemented parameters will offer no control.
- In the event that both Zone 1 and Zone 2 are in standby and the unit will not respond to driver commands to switch on, check that the power options have been configured according to the **Device Configuration** section above. If the Standby Mode is set to "Auto" and not "manual" the unit will not respond to driver commands when in standby.
- If a source is not listed under **Diver Commands** above, this driver offers no direct control of that device.
